

BUSINESS MODEL · MARKET · COMPETITIVE SCALING

Anveshak

Business Model, Market & Competitive Scaling Report

A business-pitch analysis of the Indian GRC, critical-infrastructure audit, and regulatory supervision software market.

CORE PROPOSITION

Anveshak converts existing SOC alert, case, and audit-log data into searchable, benchmarked, and explainable supervisory risk intelligence.

Prepared for business strategy, pitch-deck development, and B2G commercialisation planning.

01 Executive Summary

THESIS

India is moving from point-in-time compliance audits toward continuous, evidence-based regulatory supervision. Regulators — CERT-In, RBI, SEBI, IRDAI, and NCIIPC — each mandate recurring cybersecurity audits and oversight of regulated entities, creating a market for software that turns raw SOC data into structured, defensible supervisory findings.

Anveshak should be positioned not as another SIEM or alert-correlation tool, but as a **supervisory evidence layer** that sits above existing SOC infrastructure and serves the regulator's side of the relationship, not just the entity being regulated.

BUSINESS THESIS

Acquire a regulator or NCIIPC pilot deployment, expand the number of covered entities and detector modules, and generate recurring revenue through licensing, managed deployment, integrations, custom rule packs, and annual maintenance.

MARKET VALIDATION

Public company data shows that GRC and cyber-risk-quantification platforms — MetricStream and Safe Security among them — have already built substantial businesses around exactly this supervisory / compliance analytics category.

02 Market Opportunity

MARKET

The core market problem: regulators can mandate that entities log and report SOC activity, but they cannot manually review every alert, case, and audit record across every regulated entity. The commercial value shifts from the SOC tooling itself to the **supervisory intelligence layer** that reviews it on the regulator's behalf.

USD 1.79B

India's GRC platform market size in 2025 [1]

6 Sectors

Critical sectors designated by NCIIPC [2]

4 Regulators

CERT-In, RBI, SEBI, IRDAI each mandate cyber audits [3]

Typical regulator requirements include:

- Periodic third-party cybersecurity audits of regulated entities
- Continuous SOC/alert-handling oversight, not just point-in-time audits
- Cross-entity peer benchmarking within a sector
- Escalation and incident-handling accountability tracking
- Audit-log completeness verification
- Evidence-backed findings usable for regulatory action
- Integration with each entity's existing SOC/SIEM/case-management tools

03 Existing Solution Landscape

MARKET

The competitive market can be divided into four broad layers — with Anveshak positioned as a focused supervisory-evidence layer.

Layer	Examples	Role
SIEM / SOC tooling	Splunk, QRadar, Securonix	Real-time alert correlation — operational, not supervisory
GRC platforms	MetricStream, Resolver, Archer	Enterprise-wide risk/compliance workflow — broad, not SOC-evidence-specific
Compliance audit firms	SISA, Big 4 cyber-audit arms	Manual, periodic third-party audits — point-in-time, not continuous
Anveshak	Supervisory evidence layer	Batch detection + peer benchmarking + explainable evidence, continuous and regulator-facing

04 Competitor Case Study — MetricStream

COMPETITION

MetricStream is an AI-powered GRC platform with an R&D center in Bangalore (HQ in San Jose), offering cybersecurity, compliance, and internal-audit modules to large enterprises globally. [4]

\$252.1M

Reported annual revenue (global) [4]

\$213M–\$375M

Total funding raised across sources [4][5]

FINANCIAL CAVEAT

Public third-party sources disagree on MetricStream's exact funding total. For a pitch deck, revenue is the safer headline metric unless the statutory filing is independently reconciled.

LESSON FOR ANVESHAK

The scalable product is not a single detector — it's the platform around it: peer benchmarking, evidence drill-down, integrations, and long-term regulator contracts.

05 Competitor Case Study — Safe Security (formerly Lucideus)

COMPETITION

Safe Security is an Indian-founded (2012, by Saket Modi) cyber-risk-quantification platform offering Cyber Risk Quantification (CRQ), Third-Party Risk Management, and Continuous Threat Exposure Management modules. [6][7]

\$170M

Total funding raised across 13 rounds [7][8]

■86 Lakh

FY22 revenue, India filing entity [6]

—68.7%

YoY change vs. ■2.8 Cr in FY21 [6]

FINANCIAL CAVEAT

The India-entity revenue figure likely understates the company's actual global scale after its 2021 rebrand and shift of primary revenue to the US parent entity — the same caution the AankhoDekha report applied to Videonetics.

LESSON FOR ANVESHAK

A founder-led, India-origin risk platform can scale to real global funding rounds without needing to be a full GRC suite — a focused, sharp proposition is enough to build a fundable business.

06 What the Existing Players Prove

COMPETITION

The public examples support four commercial conclusions:

Regulators are real, funded buyers RBI, SEBI, and CERT-In already mandate periodic audits and GRC tooling adoption.	Recurring relationships matter Audits and licenses renew annually by regulatory mandate, not customer choice.
Scale comes from integration Platforms become more valuable connected to each entity's SOC/SIEM/case tools.	Expansion is easier after proof A successful NCIIPC pilot becomes the reference for expansion across sectors.

07 Anveshak Business Model

MODEL

Positioning: Anveshak should be sold as a supervisory evidence platform for regulators, not a one-time detection script.

Revenue Stream	What the Customer Pays For	Revenue Character
Platform licensing	Annual licence based on entities, sectors, and users	Recurring
Managed on-prem deployment	Hosting support, updates, monitoring within own infra	Recurring
Integration	Connectors into each CSE's SOC/SIEM/case-management tools	Project + expansion
Custom detector modules	Sector- or regulator-specific rule packs	High-margin add-on
AMC / support	Maintenance, updates, technical support	Annual recurring
Training	Supervisor onboarding, rule-tuning workshops	Service revenue
System-integrator partnerships	Participation in larger govt cybersecurity programmes	Scale channel

08 The Revenue Engine

MODEL

Anveshak should be designed around an expansion model, not a one-off project model.

This creates a customer lifecycle in which the initial deployment is the entry point and recurring services become the long-term revenue base.

09 Illustrative Contract Economics

MODEL

Strategic planning example — not a quoted market price or forecast.

Pilot Component	Illustrative Value	Share
Platform licence	■10 lakh	42%
Integration (SOC/SIEM connectors)	■6 lakh	25%
Customisation (sector rule tuning)	■4 lakh	17%
Training	■2 lakh	8%
Year-1 AMC	■2 lakh	8%
Illustrative Year-1 contract	■24 lakh	100%

As deployment expands from one sector to multiple regulators, additional entity licences, rule packs, and integrations increase contract value. Actual pricing depends on procurement structure and scope.

10 Scaling Strategy

GROWTH

Phase	Scope	Focus
Phase 1 — Pilot	1 sector, 3–5 entities	Establish detection accuracy and explainability benchmarks
Phase 2 — Sector-wide	One full sector (e.g., all Power CSEs)	Peer benchmarking becomes statistically meaningful
Phase 3 — Multi-sector	Power + Banking + Telecom	Cross-sector reference deployment
Phase 4 — Multi-regulator	RBI / SEBI / IRDAI adopt alongside NCIIPC	Regulator-level licensing
Phase 5 — National	All CII sectors	Reusable platform across India's full CII mandate

Scaling flywheel

Pilot → Measurable accuracy → Case study → Regulatory mandate/tender → Larger deployment → Recurring revenue → More references → More sectors ■

11 Anveshak's Differentiation

GROWTH

Anveshak should avoid unsupported claims that competitors lack explainability or auditability — MetricStream and Safe Security both offer real risk-scoring and audit features. The stronger positioning is **evidence transparency**: every score connects to the exact record that produced it.

“From flag to evidence.”

12 Go-to-Market Strategy

GROWTH

13 Key Business Risks & Mitigation

RISK

Risk	Mitigation
Long government sales cycles	Use pilots, SI partnerships, and reference deployments
Large incumbents (MetricStream, Safe Security, SIEM vendors)	Focus on the narrow supervisory-evidence niche, not broad GRC
Detector false positives / threshold tuning	Validate against known ground truth; publish precision/recall once real data is available
CSE reluctance to share SOC data	Offline/on-prem architecture, zero external calls, CSE-controlled deployment
Regulatory fragmentation (RBI vs. SEBI vs. CERT-In formats)	Modular schema adapters per regulator's data format
Procurement complexity	Clear licence, integration, and AMC packages that fit government procurement

14 Future Revenue Expansion

GROWTH

-
- Local embedding-based similarity detection (smarter duplicate/template-note detection)
 - Predictive risk-trend modeling (early warning before a score crosses Severe)
 - Additional regulator-specific rule packs (RBI / SEBI / IRDAI formats)
 - Configurable data retention and privacy controls
 - Natural-language finding summaries for non-technical reviewers
 - RBAC and in-app supervisor action logging
 - New modules for additional CII sectors (Transport, Government, Strategic Enterprises)
 - State/regulator-level deployments through consulting partnerships

15 Competitive Financial Snapshot

FINANCIALS

Company	Reported Revenue	Funding	Note
MetricStream	~\$252.1M (global)	\$213M–\$375M (sources vary)	India R&D; center only; revenue is global
Safe Security	■86 lakh (India entity, FY22)	\$170M across 13 rounds	India-entity revenue understates global scale post-rebrand

These figures are drawn from third-party company-data platforms and press coverage, and should be treated as secondary-source figures — useful for market context, not audited financial claims.
[4][5][6][7][8]

16 Business Pitch Conclusion

CLOSE

The opportunity for Anveshak is not to out-build MetricStream's full GRC suite or Safe Security's risk-quantification platform. It's to own a narrower, sharper category: **continuous, evidence-linked supervisory analytics** for the regulators that already mandate SOC oversight across India's critical sectors.

The commercial model follows a simple progression: enter through a pilot with one regulator, prove detection accuracy against real evidence, expand across sectors, and convert into a recurring licence/AMC relationship — the same path that took MetricStream and Safe Security from pilot deployments to funded, scaled businesses.

Anveshak aims to become the evidence layer that turns India's existing SOC and audit data into traceable, benchmarked, and actionable supervisory intelligence.
